

Banking Cloud Storage Modernization: Demo Proposal

Prepared By: Dev Varshney, Cloud Infrastructure & DevOps
Date: July 6, 2026

1. Executive Summary

This document outlines the required architectural changes to the current cloud storage infrastructure for our core banking application demo. The objective is to transition from legacy, monolithic block storage to a highly scalable, compliant, and cost-effective object storage model utilizing modern cloud-native practices.

2. Current Architecture vs. Proposed Architecture

Component	Current State (Demo V1)	Proposed State (Demo V2)
Customer Document Storage	On-premise NAS & basic block storage	Multi-region Cloud Object Storage (e.g., AWS S3 / GCP Cloud Storage)
Archival Data	Standard tier, high cost	Cold storage tiers (Glacier/Archive) with automated lifecycle policies
Deployment Pipeline	Manual provisioning	Automated CI/CD via Jenkins & GitHub Actions

3. Required Configuration Changes

To support secure financial transactions and increased data loads, the following modifications to our cloud environment are requested:

- **Enable Object Versioning:** Essential for preventing accidental deletion of sensitive

financial records and maintaining audit trails.

- **Implement Strict Access Controls:** Transition to IAM roles and temporary token-based access for our containerized microservices (Docker/Kubernetes).
- **Lifecycle Management Rules:** Automatically transition transaction logs older than 90 days to cold storage.
- **Cross-Region Replication (CRR):** Enable CRR for the primary KYC document buckets to ensure disaster recovery compliance.

4. Technical Implementation

Below is a sample Terraform configuration snippet to deploy the secure storage bucket for the upcoming demo environment:

```
resource "aws_s3_bucket" "bank_demo_secure_docs" {
  bucket = "demo-bank-kyc-docs-2026"
}

resource "aws_s3_bucket_versioning" "demo_versioning" {
  bucket = aws_s3_bucket.bank_demo_secure_docs.id
  versioning_configuration {
    status = "Enabled"
  }
}
```

5. Next Steps

Please review the proposed storage changes. Once approved, the team will trigger the infrastructure pipelines to provision the updated resources in the staging environment for the upcoming stakeholder presentation.
